DERIVATIVES

Definition:

Derivative: $f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$ if this limit exists.

Applications: If $y = f(x)$ then,
- $m = f'(a)$ is the slope of the tangent line to y=f(x) at x=a and the equation of the tangent line at $x = a$ is given by $y = f(a) + f'(a)(x - a)$.
- $f'(a)$ is the instantaneous rate of change of $f(x)$ at $x = a$.
- If $f(x)$ is the position of an object at time x, then $f'(a)$ is the velocity of the object at $x = a$

Critical points:
$x = c$ is the critical point of $f(x) = c$ provided either **1.** $f'(c) = 0$ or **2.** $f'(c)$ does not exist.

Increasing/Decreasing
- If $f'(x) > 0$ for all x in an interval I, then f(x) is increasing on the interval I.
- If $f'(x) < 0$ for all x in an interval I, then f(x) is decreasing on the interval I.
- If $f'(x) = 0$ for all x in an interval I, then f(x) is constant on the interval I.

Concavity
- If $f''(x) > 0$ for all x in an interval I, then f(x) is concave up on the interval I.
- If $f''(x) < 0$ for all x in an interval I, then f(x) is concave down on the interval I.

Inflection Points
$x = c$ is an inflection point of f(x) if the concavity changes at $x = c$.

INTEGRATION

Definition: Suppose $f(x)$ is continuous on $[a, b]$. Divide $[a, b]$ into n subintervals of width Δx and choose x_i^* from each interval. Then

$$\int_a^b f(x)dx = \lim_{n \to \infty} \sum_{i=1}^{\infty} f(x_i^*)\Delta x \quad \text{where } \Delta x = \frac{(b-a)}{n}$$

Fundamental Theorem of Calculus: Suppose $f(x)$ is continuous on $[a, b]$, then

Part I: $g(x) = \int_a^x f(t)dt$ is also continuous on $[a, b]$ and $g'(x) = \frac{d}{dx}\int_a^x f(t)dt = f(x)$ where $a \le x \le b$.

Part II: $\frac{d}{dx}\int_a^b f(x)dx = F(b) - F(a)$ where $F(x)$ is any anti-derivative of $f(x)$, i.e, a function such that $F' = f$.

Applications:

Area between Curves:
- $y = f(x)$; $A = \int_a^b (upper - lower\ funtion)dx$
- $x = f(y)$; $A = \int_a^b (right - left\ funtion)\ dy$

Volumes: $V = \int_a^b Area(x)\ dx$

Volume of Revolution

Rings $V = \int_a^b 2\pi (outer\ r^2 - inner\ r^2)$

Cylinders $V = \int_a^b circumference \cdot height \cdot thickness$

Work: If a force of $F(x)$ moves an object in $a \le x \le b$, then the work done is $W = \int_a^b F(x)dx$

Average Function Value: The average value of $f(x)$ on $a \le x \le b$ is $f_{average} = \frac{1}{b-a}\int_a^b f(x)dx$
